

EASYLABEL® Job List File

Do you print the same labels on a regular basis? Do you need to print a specific sequence of labels? Then you should look at EASYLABEL's Job List File feature. A Job List File is basically a saved print queue. Job Lists can be created to print specific sequences of labels. This provides an EASY way to automate repetitive printing for tasks such as pick lists.

Any number of Job List Files can be created, saved, and then loaded for printing at any time. This allows you to save Job Lists for individual products, shifts, days, or even users.

A Job List can be opened, and all the jobs in the list can then be added to the Print Queue in one operation. It is also possible to send individual jobs or a selected group of jobs from the Job List to the Print Queue.

You can delete jobs, modify jobs and change their position within the Job List by using selections from the menu or the toolbar buttons.

The printing of some jobs in the Job List can be delayed until the user wants them to print. The jobs can be added to the Job List with 'Hold Job' set to 'Yes'. When the Job List is sent to the Print Queue these jobs are added in a frozen state while the rest of the jobs in the Job List print. To print these jobs a user must unfreeze the job in the Print Queue.

Job Lists can be shared or used on multiple systems but in order for a Job List File to function correctly the formats, file paths, and selected printers must be set up identically in each system. Otherwise, errors will occur and the jobs will not be printed correctly.

Job List Files do not require any programming experience or special syntax. Therefore, they are an EASY way to automate label printing by loading the print queue with multiple print jobs. Using Job List Files ensure that all the necessary labels are sent and reduces the chance that a required label is missed.
